

International Public Notice: Earth Expansion in Progress

By Anna Von Reitz

It looks like Mother Nature is about to add her two cents to the public melee.

For the last twenty years there have been earthquakes and geologic changes throughout Africa's Great Rift Valley, one of the oldest geologic features on any landmass on Earth.

It appears that the massive geologic formation that caused the Rift Valley in the first place is now very active for the first time in a couple hundred million years, and that the African Continent as a whole is in the process of splitting apart along a longitudinal axis, which would create a new "continental island" composed of much of Eastern Africa and a new sea passage connecting the Mediterranean to the Indian Ocean and South Pacific.

This pulling apart of the African Continent could continue at its present slow and deliberate pace, or it could suddenly and cataclysmically rupture at any time.

Nobody knows nor can predict exactly how or when this obvious movement will resolve and come to rest again, but the now gaping rift in the floor of the Rift Valley and a mammoth increase in earthquake activity in the Santorini Island area of the Greek Aegean are both self-evident indicators that the Earth is changing and this time, it appears to be expanding on both sides of the globe.

We know that such Earth movements and migrations of land masses have occurred in the past and must assume that they are now occurring again.

Vastly increased volcanic activity along both major underwater mid-ocean ridges for the past fifty years has contributed greatly to increased atmospheric carbon dioxide, methane levels, and decreased ozone levels (which have also been harmed by ionospheric "heaters" like the HAARP antenna array) but may also portend an expansion of the Earth's girth.

We have no control of this activity, are not responsible for it, and can't do much more than observe it and make damage control plans to the best of our ability --- including making informed decisions about infrastructure development and disaster preparedness.

Imagine what happens when the rift in the Rift Valley opens up a sea lane between the newly created Island of East Africa and what will be the mainland of Africa? The Mediterranean Basin will no longer be a closed system. What sea level changes can we anticipate as the Earth re-establishes equilibrium? What parts of the current land mass will be underwater? Which parts will rise up? What effect will the new Island have on existing land masses in the region?

If the Earth increases its circumference by only a few miles, what impact does this have on day length, orbital velocity and pathways, and all the other factors that life depends upon?

It's as if, while we are consumed with political mayhem and corruption on every side, the Earth is quietly reminding us of her eternal importance and evolution --- with or without our notice or approval.

Many of the observable aspects of climate change are related to the increased mid-ocean volcanic activity and have very little to do with our activities at all. The cynical attempts to make a buck off misrepresenting the situation as "human caused" and also to use this as an excuse to create coercive climate regulation authorities is the height of duplicitous arrogance at a moment when our humility and understanding is required.

The Earth itself is undergoing a birth process that will impact billions of lives. The least we can do is pay attention and plan to protect people and communities to the extent possible.

For example, would it be possible to pre-build dams and water containment baffles in the Rift Valley to pre-empt catastrophically fast flooding? Or is the scale of such a geologic change simply too vast for our efforts to make any difference? Can we project water levels involved in opening up the Mediterranean Basin? Will the Mediterranean flow out, or the Pacific flow in? What impact will this change have on sea levels worldwide?

What, if anything, can we do to prepare for the unimaginably high level earthquakes and volcanic activity we can expect to be generated by the movement of a large chunk of Africa to the East of its present location?

While the insane people working as government contractors scheme about controlling sea lanes and man-made canals (two more, one through Mexico and one of the eastern side of the Sinai Peninsula, in addition to the Panama and Suez Canals) the Earth is making her own plans.

The government corporations and all their science nerds and experts have known about this situation as it has developed over the course of decades, and instead of being honest with the people of this planet, they have been so small-minded and maniacal as to keep it quiet and try to use the symptoms of this major geologic shift as an excuse to impose more taxes and regulatory systems benefiting themselves and their pathetic bottom lines.

With the rift in the Rift Valley opening up and over 200 earthquakes in the Aegean, it's past time for both sovereign government officials and government services personnel to face facts and stop the gaslighting.

In the past, during such large Earth changes, entire huge coastal plains have been submerged, taking millions of lives with them. What are we doing to predict and limit similar losses now?

There is a worthy project for DARPA, Mr. Trump, instead of scheming to make a buck on patenting illegal bioweapons. And all the NATO countries can also get their heads out and consider what Mother Nature's idea of a new canal means for them.
