

## Mia Culpa, Again

By Anna Von Reitz

Though I make every effort to review the scientific evidence -- patents and research data, there is no guarantee that the truly important pieces that lead directly to the correct conclusion are in the mix under review, so, with no intention to gaslight anyone about anything, it appears that Dr. David Martin and I and many other Worthies may have been chasing the wrong racoon --- earlier version developments and prototypes and research quite unrelated to the bioweapon that was in fact deployed and the propaganda campaign released around it.

So, to set the record straight in view of information brought forward by Karen Kingston in The Kingston Report this week--- and I quote:

"Our bodies aren't producing spike proteins from viral SARS-CoV-2 mRNA. Spike proteins are smart magnetic hydrogel, Ai bioweapons, preloaded in the 'vaccines.'"

So, contrary to the information we've had available, the mRNA "payload" is a red herring and this product is not using anything like the normal cellular highjacking mechanisms that, for example, cause genetically engineered corn cells to self-produce pesticide proteins.

According to the information Karen Kingston has provided, that's not the mechanism or nature of the evil that has been set upon us.

It's a pre-loaded complete product, free-standing on its own, not needing to hijack the cellular genetic machinery to manufacture the spike protein, because the spike protein is already present in sufficient quantity within the injection serum itself -- and the only apparent importance of the SARS-CoV-2 research was to provide a smokescreen -- make people believe there was an infectious disease involved, so that they would readily accept the injections.

It remains to be seen in what sense this hydrogel is "smart" even though the verbiage is being used in the same way as a "smart meter" or "smart television". Apparently, it's able to receive and respond to wi-fi type radiation signals, but what exactly can it do?

One can imagine some evil Svengali sending out a signal to such "smart" hydrogel telling it to self-replicate and clump up in the veins and arteries upon command. Or maybe it's something "less smart", for example, the hydrogel only forms clots when it has been exposed to a certain threshold amount of wi-fi radiation for a certain period of time, similar to a chemical reaction that requires a given amount of heat to get it started.

Hopefully, Karen Kingston will be providing insight into precisely how this hydrogel works and how it interacts with wi-fi signals as an Artificial Intelligence component. For example, does it somehow collect data about the victim's health? Allow drone operators to interject foreign thoughts and impulses? Or does it focus on a single simple but devastating function, like causing blood clots in our brains?

Our complete thanks to Karen Kingston for nailing it to the floor and getting beyond the smoke and the "obvious conclusions" --- and treeing the ring-tailed beastie we've all been after these past two years: "a smart magnetic hydrogel".

Start following along with The Kingston
